

Components of Image processing -

Digital Image processing consists following components -

- ① Image sensors - Image sensors sense the intensity, amplitude, co-ordinates and other features of image and pass the result to image processing.
- H/W

- ② Image processing Hardware - Image processing hardware ~~processor~~ is the dedicated h/w.

that is used to process the instruction, then pass to general purpose computer

- ③ Computer — computer used in image processing system.
- ④ Image processing software — SW that includes all the algorithms & mechanism required to image processing system.
- ⑤ Main Storage — main storage is about to the pixels of image during the processing.
- ⑥ Hard copy device — once the image is processed then it is stored in hard copy device. Pen drive & external ROM device.
- ⑦ Image display — It includes monitor or display screen that display the processed images.
- ⑧ Network — Network is the connection of above elements of Digital Image processing system
